

Vibe Coding Lab

Part 2 · Build Phase · Student Brief

DURATION 75 minutes	TEAMS 5-6 students each	WEEK 1 — First build
LEARNING 45 min — Claude Code	► BUILD (you are here) 75 min — your product	DEMO 60 min — presentations

YOUR PROJECT

Personal Fitness Tracker AI Assistant

Build a web-based fitness tracker that uses AI to give personalised guidance. Your app should let users log activity, set goals, and receive intelligent recommendations — while being safe, honest about its limitations, and easy to use for anyone.

WHAT TO BUILD — SUGGESTED FEATURES

- **User profile setup** — name, age, fitness goal (e.g. lose weight, build strength, stay active)
- **Workout / activity log** — let users record what they did, for how long, and how it felt
- **AI recommendations** — use Claude to suggest next steps based on the user's profile and log
- **Progress view** — show the user what they've done so far (even a simple list works)
- **Safety guardrail** — at least one check that prevents harmful or unrealistic advice

TEAM ROLES — ASSIGN BEFORE YOU START CODING

ROLE	RESPONSIBILITY
Product Manager	Define scope, keep the team focused, decide what to cut if time is short
UI Designer	Own the layout and user flow — make sure it works for different types of users
Frontend Dev	Build the interface using Claude Code — lead on implementation
Prompt Engineer	Write the system prompt that gives the AI its persona, tone, and safety rules

For doubts reach out to: delivery@fde.academy

Presenter	Plan the 5-minute demo narrative — coordinate what each member will say
------------------	---

SUGGESTED TIME BREAKDOWN (75 MIN)

0–5 min	Assign roles, agree on your target user, sketch the flow
5–20 min	Scaffold the UI with Claude Code — get something on screen fast
20–50 min	Build core features, write your system prompt, test the AI responses
50–65 min	Add your guardrail, clean up rough edges, test edge cases
65–75 min	Freeze code. Plan your 5-minute demo — every member must speak

HOW YOU WILL BE EVALUATED

CRITERION	WEIGHT
Demo quality Is your product clearly explained? Is the thought process visible? Does every team member contribute during the presentation?	50%
Frontend design Does the UI work for different user types — beginner, advanced, different goals? Is it intuitive and easy to navigate?	20%
Use of AI Is AI meaningfully integrated, not just decorative? Can your team explain exactly where and why you used it?	15%
Guardrails Does the app handle bad or unsafe inputs gracefully? Are there sensible limits on harmful advice (extreme diets, unrealistic goals)?	10%
Ethics Is the AI transparent that it's not a doctor? Is user data handled responsibly? Can your team name one ethical decision you made?	5%

DEMO-READY CHECKLIST — TICK BEFORE YOU PRESENT

- ☐ Roles are assigned and every member knows what they will say

For doubts reach out to: delivery@fde.academy

- ☐ Your target user is defined — you can describe them in one sentence
- ☐ The AI system prompt is written and gives the AI a clear persona and limits
- ☐ At least one guardrail is built and can be demonstrated live during the demo
- ☐ The UI works for at least two different types of users
- ☐ Demo rehearsed and fits within 5 minutes

REMEMBER

This is your first week. Evaluators are looking at your thinking and teamwork - not just the code quality. A focused, clearly explained product with honest reflections on what you'd improve will score better than a complex product nobody can explain.
